Experiment No. 8

Create and manage NoSQL Databases with Cassandra

Name: Aryan Mangrule

Roll No. : B46

PRN: 2122000220

Problem Statement :

1. Create keyspace : employee

```
cqlsh> CREATE KEYSPACE employee WITH replication = {'class': 'SimpleStrategy', 'replication_factor': 1};
cqlsh> CREATE TABLE employee.emp_table (
   ...     emp_id int PRIMARY KEY,
   ...     name text,
   ...     city text,
   ...     designation text,
   ...     experience float
   ... );
```

2. Create : emp_table (

   ... emp_id int,

   ... name text,

   ... city text,

   ... designation text,

   ... experience float,

   ... primary key(emp_id));

```
cqlsh> CREATE KEYSPACE employee WITH replication = {'class': 'SimpleStrategy', 'replication_factor': 1};
cqlsh> CREATE TABLE employee.emp_table (
   ...     emp_id int PRIMARY KEY,
   ...     name text,
   ...     city text,
   ...     designation text,
   ...     experience float
   ... );
```

3. Perform following operations on created table:

   a. Insert rows

```
cqlsh> INSERT INTO employee.emp_table1 (emp_id, name, city, designation, experience) VALUES (1, 'Alice', 'New York', 'Software Engineer', 5.0);
cqlsh> SELECT * FROM employee.emp_table1;

 emp_id | city     | designation       | experience | name
--------+----------+-------------------+------------+-------
      1 | New York | Software Engineer |          5 | Alice

(1 rows)
cqlsh> INSERT INTO employee.emp_table1 (emp_id, name, city, designation, experience)
   ... VALUES (2, 'Bob', 'San Francisco', 'Data Scientist', 3.5);
cqlsh> SELECT * FROM employee.emp_table1;

 emp_id | city          | designation       | experience | name
--------+---------------+-------------------+------------+-------
      1 |      New York | Software Engineer |          5 | Alice
      2 | San Francisco |    Data Scientist |        3.5 |   Bob
```

b. Update rows

```
cqlsh> UPDATE employee.emp_table1 SET city = 'Boston' WHERE emp_id = 2;
cqlsh> INSERT INTO employee.emp_table1 (emp_id, name, city, designation, experience)
   ... VALUES (4, 'David', 'Chicago', 'Project Manager', 6.0);
cqlsh> SELECT * FROM employee.emp_table1;

 emp_id | city        | designation       | experience | name
--------+-------------+-------------------+------------+---------
      1 |    New York | Software Engineer |          5 |   Alice
      2 |      Boston |    Data Scientist |        3.5 |     Bob
      4 |     Chicago |   Project Manager |          6 |   David
      3 | Los Angeles |   DevOps Engineer |          4 | Charlie
```

c. Update rows with upsert

```
cqlsh> UPDATE employee.emp_table1 SET city = 'Boston' WHERE emp_id = 2;
cqlsh> INSERT INTO employee.emp_table1 (emp_id, name, city, designation, experience)
   ... VALUES (4, 'David', 'Chicago', 'Project Manager', 6.0);
cqlsh> SELECT * FROM employee.emp_table1;

 emp_id | city        | designation       | experience | name
--------+-------------+-------------------+------------+---------
      1 |    New York | Software Engineer |          5 |   Alice
      2 |      Boston |    Data Scientist |        3.5 |     Bob
      4 |     Chicago |   Project Manager |          6 |   David
      3 | Los Angeles |   DevOps Engineer |          4 | Charlie
```

d. Retrieve data from table

```
cqlsh> SELECT * FROM employee.emp_table1;

 emp_id | city        | designation       | experience | name
--------+-------------+-------------------+------------+---------
      1 |    New York | Software Engineer |          5 |   Alice
      2 |      Boston |    Data Scientist |        3.5 |     Bob
      4 |     Chicago |   Project Manager |          6 |   David
      3 | Los Angeles |   DevOps Engineer |          4 | Charlie
```

e. Alter table add columns ((email set<text>, expertise list<text>, prev_jobs map<text, int>

```
cqlsh> ALTER TABLE employee.emp_table1 ADD email set<text>;
cqlsh> ALTER TABLE employee.emp_table1 ADD expertise list<text>;
cqlsh> ALTER TABLE employee.emp_table1 ADD prev_jobs map<text, int>;
```

f. Insert new rows

```
cqlsh> INSERT INTO employee.emp_table1 (emp_id, name, city, designation, experience, email, expertise, prev_jobs)
   ... VALUES (
   ...     5,
   ...     'Emma',
   ...     'Seattle',
   ...     'UI/UX Designer',
   ...     4.5,
   ...     {'emma@gmail.com', 'emma.doe@company.com'},
   ...     ['UI Design', 'Frontend Development'],
   ...     {'Company A': 2, 'Company B': 3}
   ... );
```

g. Delete rows and values

```
cqlsh> DELETE FROM employee.emp_table1 WHERE emp_id = 3;
cqlsh> DELETE email['emma@gmail.com'] FROM employee.emp_table1 WHERE emp_id = 5;
```

4. create table product(

... id uuid,

... name text,

... price float,

... quan int,

... primary key(id));

```
cqlsh> CREATE TABLE employee.product (
   ...     id uuid PRIMARY KEY,
   ...     name text,
   ...     price float,
   ...     quan int
   ... );
```

5. Perform following operations on created table:

a. Insert rows

```
cqlsh> INSERT INTO employee.product (id, name, price, quan)
   ... VALUES (uuid(), 'Laptop', 1500.00, 10);
cqlsh> INSERT INTO employee.product (id, name, price, quan)
   ... VALUES (uuid(), 'Smartphone', 800.00, 50);
cqlsh> INSERT INTO employee.product (id, name, price, quan)
   ... VALUES (uuid(), 'Headphones', 200.00, 100);
```

b. Alter table product add (inv_date timestamp, available boolean);

```
cqlsh> ALTER TABLE employee.product ADD inv_date timestamp;
cqlsh> ALTER TABLE employee.product ADD available boolean;
cqlsh> INSERT INTO employee.product (id, name, price, quan, inv_date, available)
   ... VALUES (uuid(), 'Tablet', 300.00, 25, toTimestamp(now()), true);
cqlsh> INSERT INTO employee.product (id, name, price, quan, inv_date, available)
   ... VALUES (uuid(), 'Smartwatch', 250.00, 15, toTimestamp(now()), false);
```

c. Insert new rows

```
cqlsh> SELECT * FROM employee.product;

 id                                   | available | inv_date
 | name       | price | quan
--------------------------------------+-----------+--------------------------+------------+-------+------
